

NovaERP

High-Performance Manufacturing

Built for the shop floor.

A keyboard-first, scanner-first ERP unifying procurement, warehouse, manufacturing, billing, and dispatch — designed for industrial speed and offline reliability.

Avg. scan response <50 ms

Screen switch <200 ms

Offline-ready

Web · Desktop · Mobile

NovaERP is an end-to-end manufacturing ERP covering the full cycle — from raw-material procurement to dispatch — with an aggressive focus on operator productivity. Every screen is designed for one-handed scanner use, low-click workflows, and millisecond-scale response times.

Secure sign-in, three ways

Users sign in with **password**, a **4-digit operator PIN** for shop-floor speed, or a **badge scan**. The shell remembers warehouse, shift and locale, and the connection state is shown live so operators always know whether they are working online or offline.

 **NovaERP**
HIGH-PERFORMANCE MANUFACTURING

Built for the shop floor.

Keyboard-first, scanner-first ERP for warehouse, manufacturing, procurement, and billing. Operates online or offline at industrial speed.

WH-MAIN · Pune Plant

Operator PIN mode

Pre-fills last-used operator so handovers between shifts take seconds, not minutes.

Connection awareness

"Connected to backend API" badge confirms live sync before sign-in.

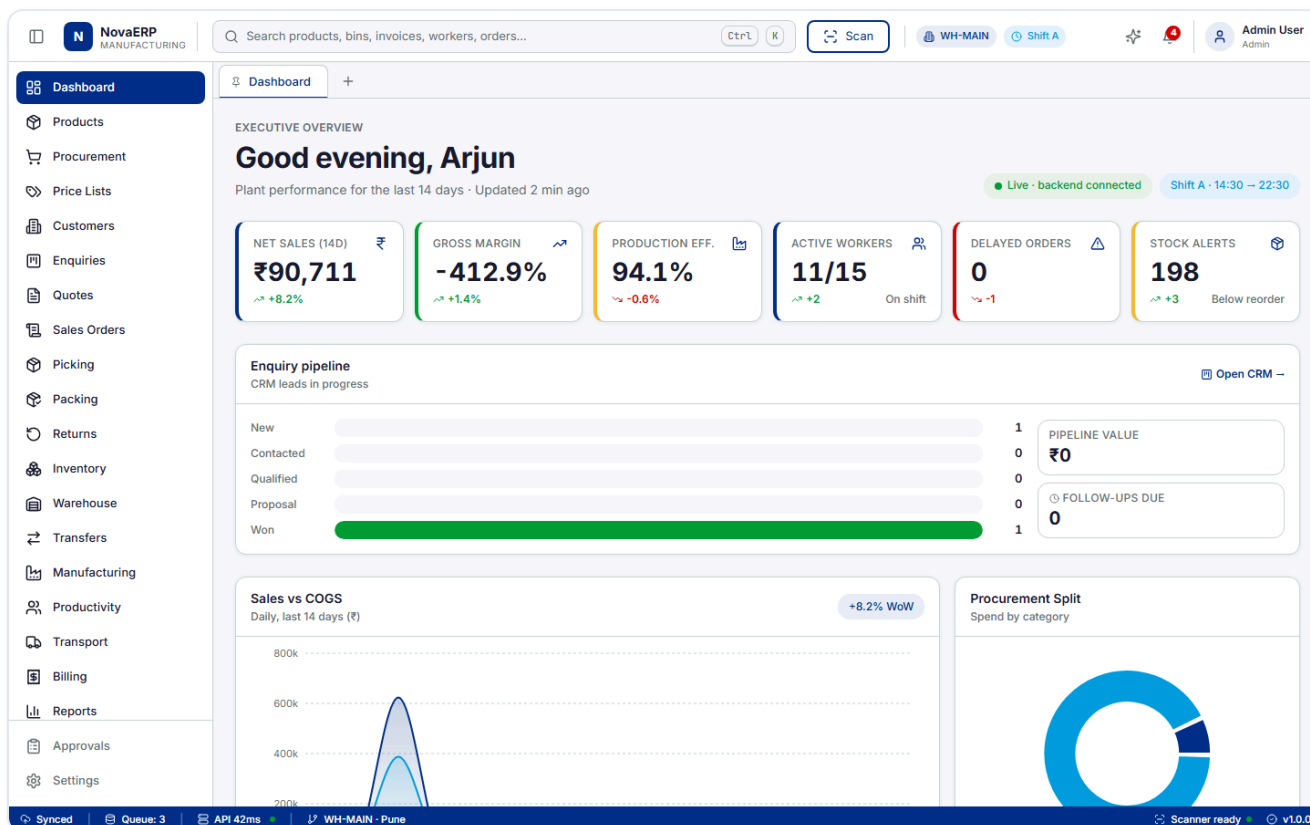

Badge / biometric ready

Reserved hooks for ID-card scan and biometric for higher-security plants.

Workspace context

Logs you into your warehouse and shift in one tap — no extra picklists.

Live KPIs the moment you log in — revenue, order pipeline, fulfilment SLA, machine availability, attendance, and alerts. Drilldowns route you straight to the relevant module instead of forcing you through menus.

Real-time KPIs

Sales, stock-on-hand, dispatch SLA, manufacturing throughput — refreshed live from the API.

Alert center

Low-stock, overdue POs, credit-limit breaches, picking backlog — never miss an exception.

Shift-aware widgets

Numbers respect the active warehouse and shift so supervisors see only their slice.

Deep links

Every tile is clickable — jump from a KPI directly to the underlying transactional list.

Items group into **product families** with short 3-4 letter codes (e.g. **COIL** for Coconut Oil, **AGRB** for Agarbathi) and unlimited variants on **size**, **scent / flavour**, and **container / grade**. The MRP and Dealer Excel sheets were imported automatically — with spelling fixes and family-grouping — yielding 319 production-ready SKUs.

API 74ms

WH-MAIN - Pune

Scanner ready

v1.0.0

Variant axes

Three independent axes (size / scent / pack) eliminate SKU sprawl while preserving granularity for billing.

Excel import

One-shot import normalises units, fixes typos like "Cardmom→Cardamom", and joins MRP+Dealer rates.

HSN & GST mapped

Tax classification stored at the product level so every invoice is GST-compliant by default.

Inline edit

Edit pricing, packaging, or status from the list without opening a separate form.

Every customer is bound to a price list — **Retail**, **Dealer**, or **Distributor**. Prices resolve through a deterministic waterfall: *explicit override* → *quantity-break tier* → *list formula* → *product default*. Changes propagate instantly to every open quote and invoice draft.

v1.0.0

Formula-based tiers

e.g. Dealer = MRP × 0.78. Define once, apply to every product automatically.

Per-SKU overrides

Pin a special price for strategic SKUs without breaking the formula for the rest.

Quantity breaks

"5–9 units: 5% off, 10+: 12% off" — applied as the operator types the qty in the quote.

Currency & validity

Time-bounded promotional price lists with automatic fallback to the standard tier.

The quote list is the sales operations heartbeat — filterable by status (*Draft, Submitted, Accepted, Converted, Expired, Rejected*), with revision badges, expiry countdown, and a one-click **Share** action per row.

Scanner ready

v1.0.0

Immutable revisions

Editing a submitted quote auto-snapshots the previous version. Full audit trail, no overwrites.

Validity tracking

Each row shows "31d left" so reps act before quotes go stale; expired quotes drop out of pipeline.

Credit-limit guardrails

Quotes exceeding limit are flagged and routed to Approvals — only those, not every order.

One-click share

Share submitted quotes via Print, link copy, WhatsApp, or Email — without leaving the list.

A single-screen drawer holds everything an inside-sales rep needs: customer + credit context, payment terms, a **type-as-you-go variant search**, live ATP (Available-to-Promise), GST roll-up, and inline rate / discount. Submit → automatically becomes a Sales Order and triggers Picking.

Token-based access

Each quote has an opaque shareToken — rotate to revoke without affecting other quotes.

Pre-filled WhatsApp / Email

Opens the user's WhatsApp / mail client with quote no, total, and link already drafted.

Print-friendly PDF

"Print / Save as PDF" opens an A4 layout optimised for the browser's print dialog.

No data leakage

The public payload is sanitised — internal cost prices, ATP, and audit IDs are stripped.

The customer opens the link in any browser — no app, no login. The page renders the quote at print quality with company branding, line-item breakdown, GST, totals, and a "Print / Save as PDF" button.

**Quote unavailable**

Login required.

Mobile-friendly

Responsive A4 layout — looks the same on phone, tablet, or laptop.

Auto-print mode

Add `?print=1` to the URL to fire the browser print dialog on load.

Brand-aware

Company name, GST, and address pull from environment config — no per-quote setup.

Read-only & secure

Public endpoint runs outside the auth wrapper but is rate-limited and token-gated.

When a Sales Order is confirmed, NovaERP auto-generates a **Pick List** with **exact bin / shelf locations** for every line. Stock is physically reserved (Bin.reservedQty) so two pickers can't race for the same crate.

Bin / shelf precision

Each line shows the exact zone/shelf/bin where the requested qty is stored.

Soft-reservation

Reserved qty is decremented from ATP immediately to prevent oversell.

Scanner-first UX

Pickers scan bin → scan SKU → enter qty. Three keystrokes, no menus.

Partial picks

Pick what's available now, balance auto-creates a back-order line for procurement.

Manufacturing rarely packs exactly what was ordered. NovaERP exposes **edit-on-pack**: the packer adjusts qtyPacked per line, and the invoice is generated from the actual packed quantity — not the ordered one. Variances roll forward into a back-order automatically.

Synced

Queue: 3

API 42ms

WH-MAIN - Pune

Scanner ready

v1.0.0

qtyPacked = invoice qty

Removes manual reconciliation between dispatch and finance — what shipped is what's billed.

Carton / case tracking

Capture carton count, weight, and dimensions for the dispatch label and freight calc.

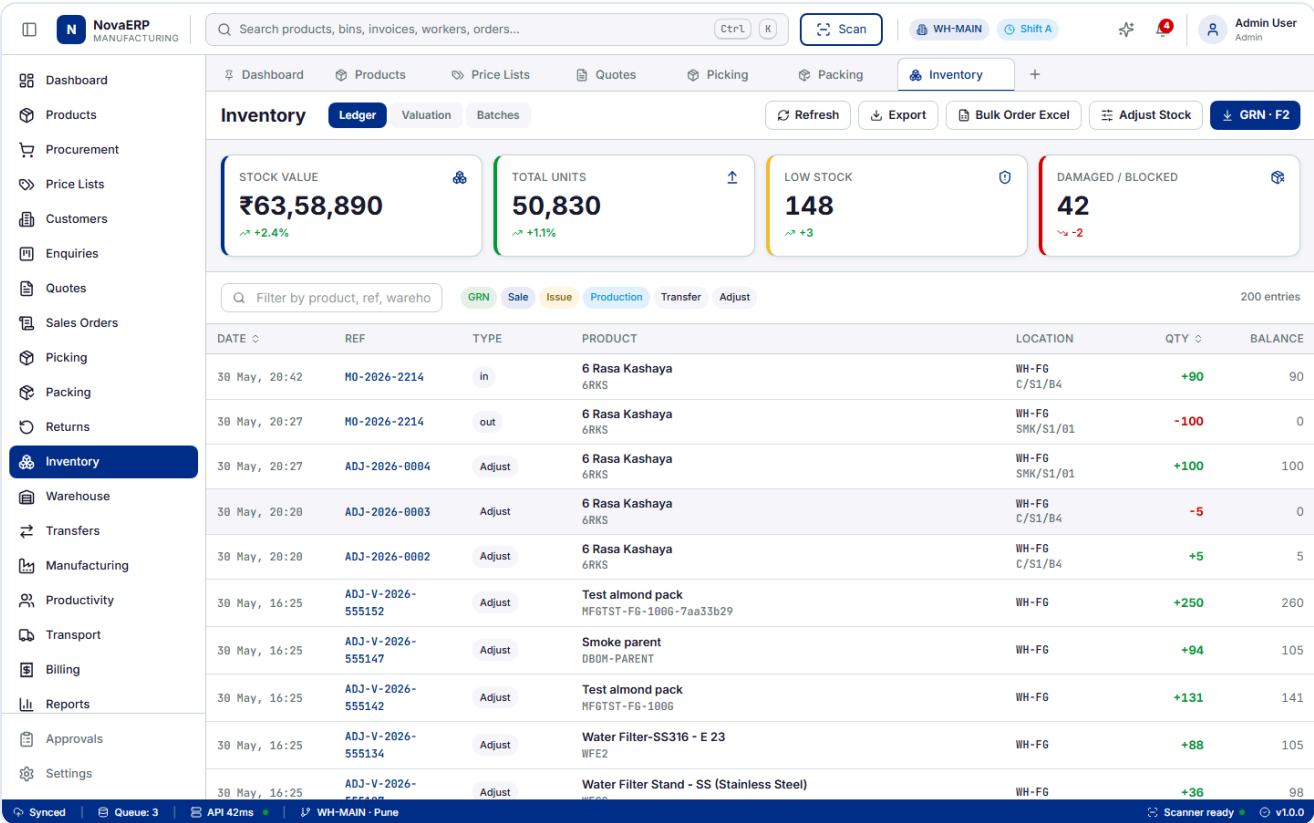

Auto back-order

If less than ordered is packed, NovaERP creates a follow-up line and notifies sales.

Atomic invoice

Generate Invoice button is one click — stock decrement and document creation happen in one DB transaction.

Stock visibility broken down per SKU, per warehouse, per bin — with running ATP that subtracts open reservations and adds expected inbound (POs in transit + active work orders). One screen, no spreadsheets.

ATP formula
onHand – reservedForSO + openProcurement + openProduction. Always live.

Bin-level drilldown
Click a SKU to see exactly which bins hold it, with batch / lot numbers.

Low-stock alerts
Reorder points trigger procurement suggestions and notifications.

Cycle-count support
Scan bins to confirm counts — variances post adjustments with audit trail.

Invoices are produced two ways — from a packed sales order (B2B), or directly through the POS for cash-and-carry. All invoices auto-number per fiscal year (INV-2026-####), capture HSN-level GST splits, and post to inventory in one atomic transaction.

POS for walk-in

Single-screen, scanner-driven POS for cash counter / wholesale outlet.

GST math, baked in

CGST/SGST/IGST split by ship-to state. Round-off configurable per row.

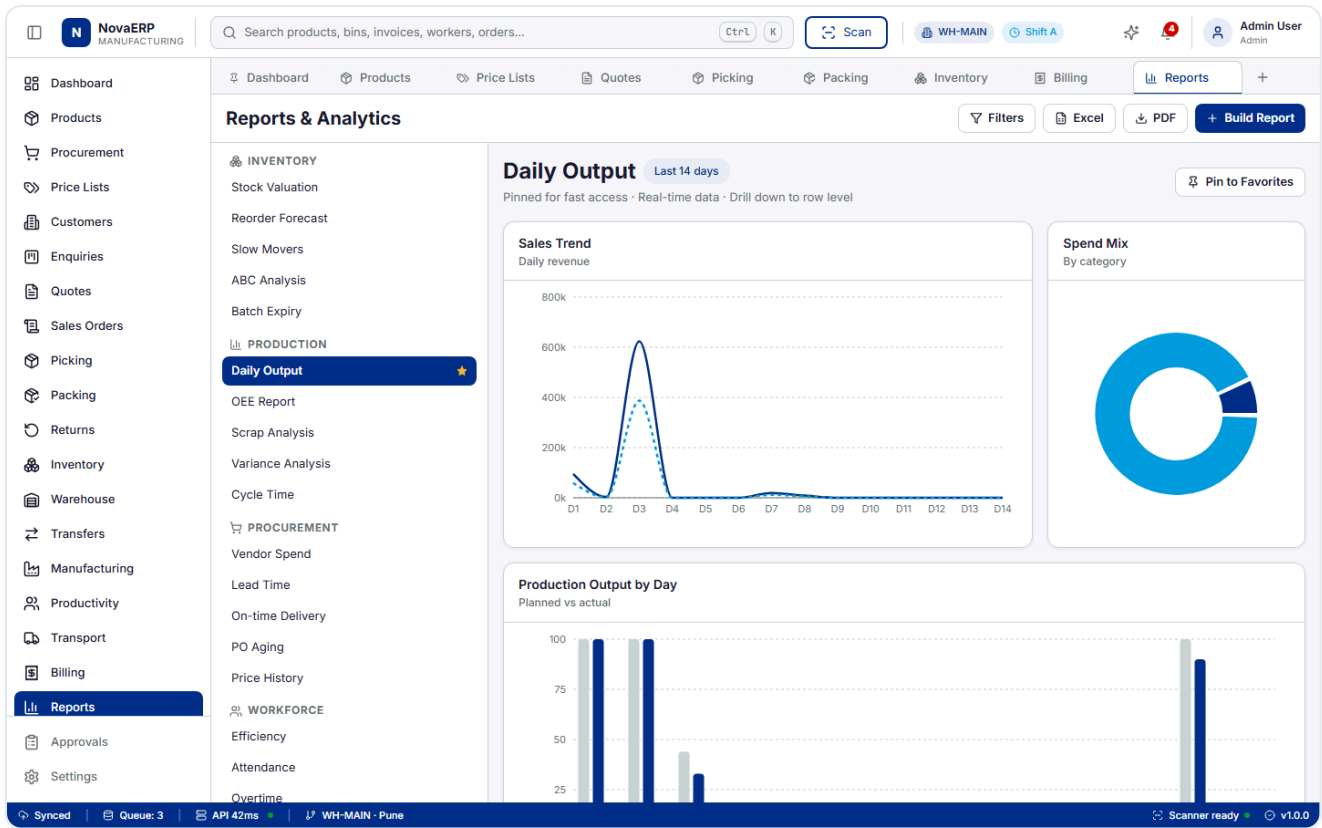

e-Invoice / e-Way ready

Output shape compatible with IRP & e-Way bill APIs for India.

Atomic stock-out

Invoice creation decrements bin stock in the same transaction — no half-states.

Sales pipeline, stock ageing, production yield, dispatch SLA, and worker productivity — visualised with drill-down charts and exportable to CSV. All reports are scoped by warehouse and date range.

Sales analytics

Top customers, top SKUs, conversion funnel quote → SO → invoice.

Inventory ageing

Slow-movers and dead stock identified at the bin level — perfect for clearance pricing.

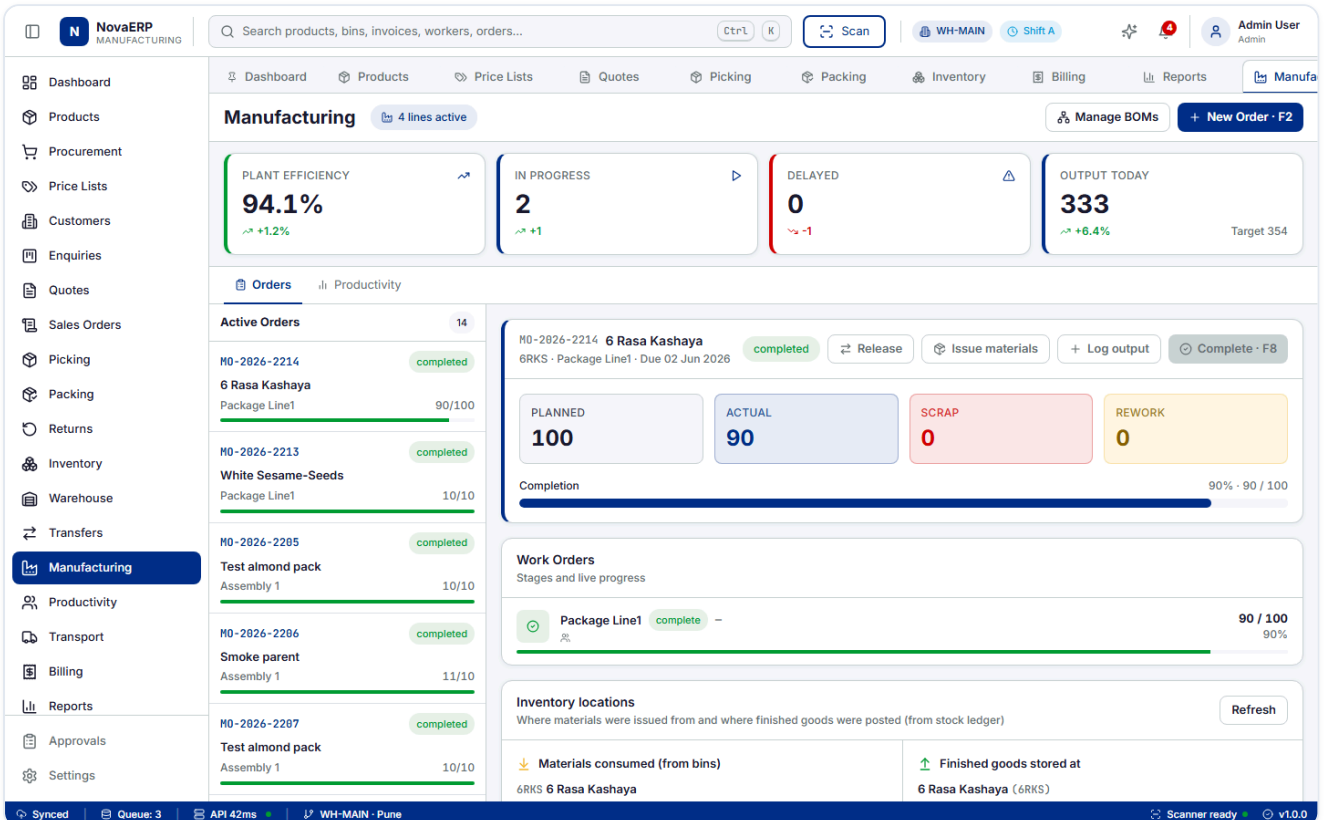

Production yield

Output vs target per work-order, per station, per shift, per worker.

Exportable

Every chart has a CSV download — paste into Excel or feed your BI tool.

Plan and run **production orders (MOs)** from a split console: active orders on the left, BOM-driven actions on the right. The flow is **Release** → **Issue materials** → **Log output** → **Complete**, with smart button states so operators cannot double-issue or complete without output.

Release & replenishment

Release creates transfer orders from storage to the production-line warehouse when line stock is short.

Issue-aware requirements

Shortage is computed against *still needed* after issue — not full BOM vs bins post-issue.

Putaway on complete

Finished goods post to configured putaway bins; optional putaway TO when line WH ≠ storage WH.

Productivity tab

Station throughput and worker output in the same module for shift supervisors.

Capture inbound interest before it becomes a quote. Enquiries track source, contact, product interest, and stage — so inside sales can qualify leads and convert winners into formal quotes without re-keying data.

NovaERP MANUFACTURING

Kanban-style stages

Move enquiries from new → contacted → qualified → won/lost with full history.

Quote conversion

One-click path from a qualified enquiry into the quote editor with customer context carried over.

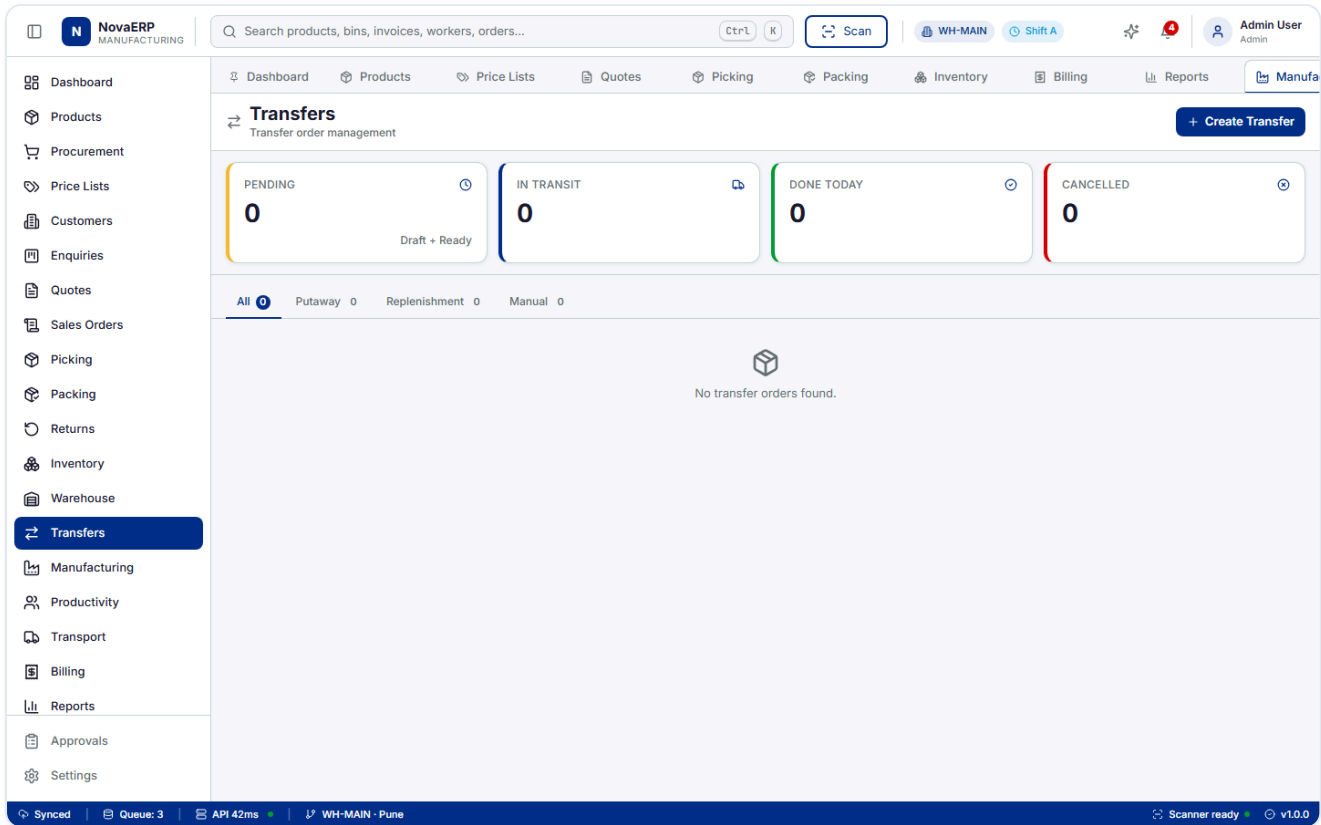

Assignment & ownership

Each row shows the responsible rep so pipeline reviews stay accountable.

Search & filters

Find open enquiries by customer, product family, or date range in seconds.

Move stock between bins and warehouses with auditable **transfer orders**. Kinds include *replenishment* (storage → line), *putaway* (line → storage), and *manual* moves. Team **tags** route tasks to the right crew on mobile.

MO-linked TOs

Release and Complete on manufacturing orders auto-create the right transfer documents.

Pick / drop lifecycle

Mobile pick decrements source bins; drop increments destination — both write ledger rows.

Team tags

Comma-separated tags on auto-replenishment TOs for cold-storage, night shift, etc.

Stock-rule triggers

Min-qty rules can spawn ready-to-run replenishment TOs when monitor bins run low.

Model every site as **warehouse** → **zone** → **shelf** → **bin** with scan codes (B.WH-MAIN.A.S1.01). The tree view shows occupancy, capacity, and product assignment — the foundation for picking, putaway, and cycle counting.

v1.0.0

3-level hierarchy

Simplified zone/shelf/bin model — no redundant rack layer — faster scans and labels.

Production-line WH

Each work center can own a dedicated production warehouse for line-side stock.

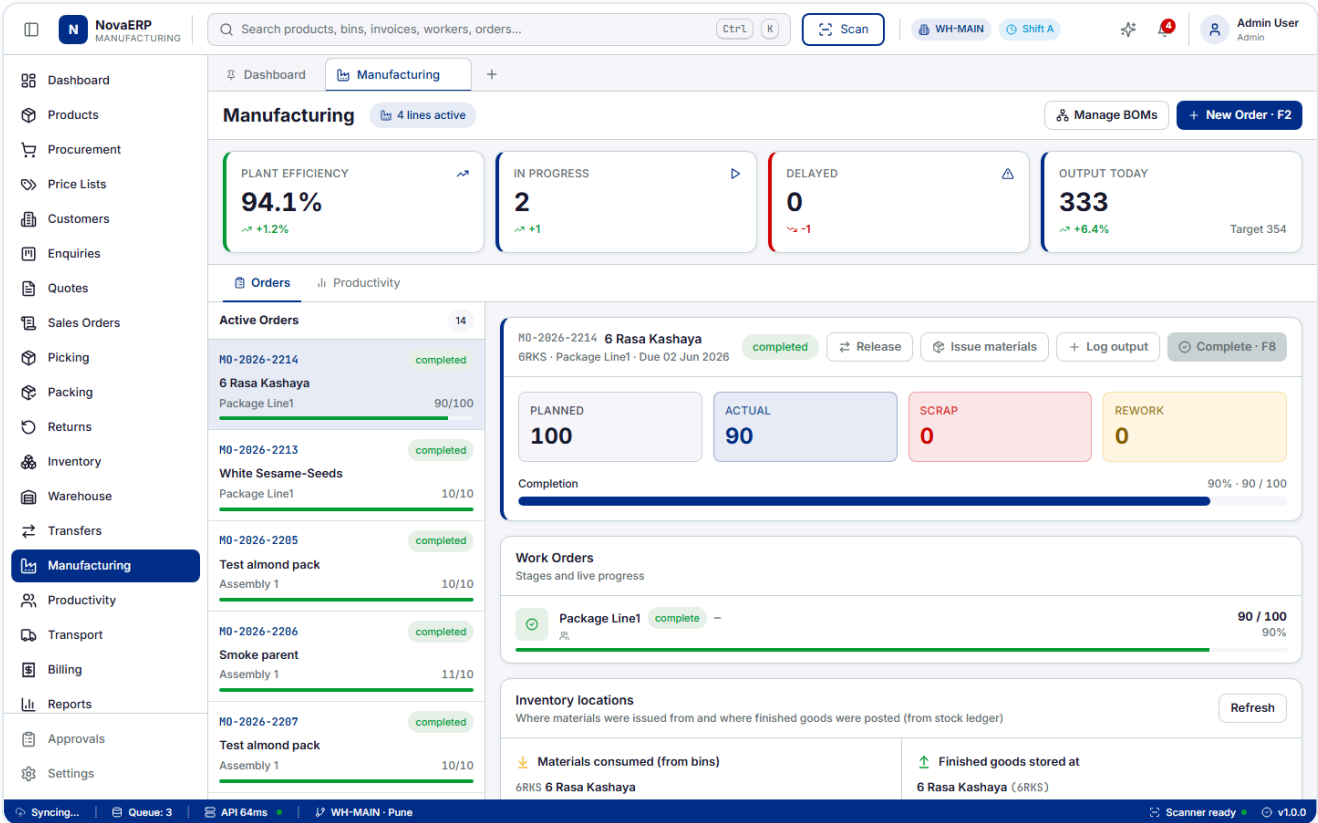

Bin labels PDF

Bulk-print location labels with embedded scan codes for floor rollout.

Capacity hints

Capacity per bin guides receive and putaway without overfilling a slot.

Drill into any MO to see **material requirements** (required / issued / still needed / shortage), linked **transfer orders**, and an **inventory locations** card built from the stock ledger — where materials were consumed and where finished goods landed.

Issue guardrails
Issue disables when all materials are issued; Release only while status is planned.

Adjust from shortage
Deep link from a shortage row straight into Inventory Adjust with product pre-filled.

Ledger-backed trail
Every Issue and Production posting shows bin path and qty — MO is workflow, bins hold stock.

Work orders
Multi-stage routing with per-stage progress bars on the same detail screen.

Every finished variant can map to a **fixed destination bin**. On MO complete, NovaERP resolves putaway first — direct post when co-located, or FG on the line plus a putaway transfer when storage is elsewhere.

Putaway rules
Each variant must have a fixed destination bin. MO complete posts FG here (no auto-pick of empty bins). [+ Add rule](#)

PRODUCT	VARIANT	DESTINATION WAREHOUSE	BIN	PRIORITY	STATUS
No putaway rules yet. Add a rule to auto-route finished goods from production to storage.					

Variant-specific

Rules can target a variant or fall back to product-level when variant is blank.

Required bin in UI

Operators must pick a destination bin — no silent auto-assign to empty slots.

Priority ordering

Lower priority number wins when multiple rules match the same SKU.

Complete integration

MO Complete uses `resolvePutawayDestination` before any fallback warehouse pick.

Monitor a bin's on-hand qty against a **minimum**. When stock drops below, NovaERP can auto-create a **planned manufacturing order** (batch size = BOM output qty) or a **replenishment transfer** with team tags. Rules fire on issue, sale, adjust, and transfer pick/drop.

MO trigger

Creates a planned MO from the configured BOM; skips if an open MO already exists for that BOM.

Transfer trigger

Pulls from a source bin to the monitor bin (or explicit destination) with shortage qty.

Check all now

Manual sweep across every active monitor bin — useful after bulk imports or go-live.

Dedup by design

Open MO/TO guards prevent duplicate automation storms on the same rule.

Why implement an ERP — the business case

Beyond the features, the real return comes from the operating model an ERP enforces: **one source of truth**, **fewer manual hand-offs**, and **real-time decisions** at every level. Industry studies (Panorama, Aberdeen, Nucleus Research) consistently report these gains within 12–18 months of go-live.

01 Single source of truth

End the war of spreadsheets. Sales, procurement, production, and finance all read and write to the same dataset, eliminating reconciliation overhead.

02 Faster cash conversion

Quotes → orders → invoices flow in minutes instead of days. Aberdeen reports a 22% reduction in order-to-cash cycle after ERP rollout.

03 Inventory accuracy ↑ 25–40%

Bin-level tracking + cycle counting drives accuracy past 98%, freeing working capital and slashing carrying costs.

04 Lower operational cost

Automated workflows replace data entry. Panorama's 2024 ERP report shows 19% reduction in administrative cost.

05 Better customer experience

Reps quote with live stock visibility, dispatch promises hold, and customers receive shareable digital quotes & invoices instantly.

06 Regulatory compliance

GST, HSN, e-Invoice, and e-Way bill handled natively. Audit-trail per document satisfies statutory and internal audits.

07 Data-driven decisions

Real-time KPIs replace gut feel. Identify slow-movers, bottleneck stations, and credit-risk customers in seconds.

08 Scalable foundation

Add warehouses, plants, or product lines without re-architecting. NovaERP's modular design grows with the business.
